

Feasibility Pass

Name _____

Feasibility isn't a yes/no verdict. It's a set of **risks you name honestly and then reduce**. In class: **Idea A** plus Parts 2–3. Before the convergence workshop: add **B** and **C**. Full guidance: the *Feasibility & Risk Worksheet* and *Learning Plan Template* pages.

1 • Rate the six risks — 3 min in class

Circle **L / M / H** in each column. Then, for each idea, **star the one or two risks that could actually sink it**. Those are the ones you de-risk first.

	IDEA A	IDEA B	IDEA C
RISK · THE QUESTION TO ASK			
Technical — is the core hard part actually doable? <i>real-time sync, offline, ML accuracy...</i>	L M H	L M H	L M H
Schedule — does a real vertical slice fit the time you actually have?	L M H	L M H	L M H
Dependency — an API, dataset, device, or service that could vanish, cost money, or rate-limit you?	L M H	L M H	L M H
Skill — a gap between what the build needs and what you know today?	L M H	L M H	L M H
Adoption — will real users actually use it, or is the need too weak?	L M H	L M H	L M H
Maintenance — can you, and future contributors, keep it running and understandable?	L M H	L M H	L M H
Overall, at one-semester scope	healthy · stretch · not realistic	healthy · stretch · not realistic	healthy · stretch · not realistic

The one thing I must prove first

Reading the ratings: one High with a spike planned is fine. What sinks projects is *unacknowledged* High risk. Three Highs and no plan means shrink the scope or pick another idea.

2 • Know / Learn / Avoid, for Idea A — 2 min

Sort what the build takes. Every **Avoid** you can justify makes the project more feasible. Routing around complexity is a skill, not a cop-out.

Know <i>can already do it — no plan needed</i> 	Learn <i>a real but learnable gap — gets a plan</i> 	Avoid <i>cut it, defer it, or use a library / service</i>
--	---	---

3 • A one-gap learning plan — 4 min · your biggest Learn item

THE GAP

WHY + what "done" means

ONE SMART GOAL

WHEN (real calendar blocks)

WHO I'LL TELL

SPIKE (question · time box)

GREEN MEANS...

SMART = Specific · Measurable · Achievable · Relevant · Timed. "Learn WebSockets" isn't a goal; "two tabs exchange messages through a server I wrote" is — you can tell when it's done.

De-risk moves — pick one for each starred risk

- Technical / Skill** → run a spike; make a learning plan
 - Schedule** → cut to a smaller vertical slice
 - Dependency** → find a fallback; confirm terms and cost now
- Adoption** → one more real user conversation
 - Maintenance** → the boring stack you can own and explain

Bring this sheet, **with B and C filled in**, to the convergence workshop.
