

Proposal Outline — 6-Minute Solo Sketch

Name _____

Six minutes, on paper, before you trade with a neighbor. Write fast — this is a **skeleton, not a draft**. Full guidance: *The Anatomy of a Software Proposal*; the graded version is **CP3**.

1 • The nine-line skeleton

One line per section — what that section will **claim**, not what the section is. "Wardrobe volunteers at three small theaters can't tell what they already own" is a claim; "describes the problem" is not.

EXEC SUMMARY (last)

2 • Your three biggest risks

A mitigation needs a **date** or a **trigger**. "I'll be careful" is not a mitigation. If a risk could appear in anyone's proposal, it isn't yours — go get a specific one.

RISK — SPECIFIC TO YOUR PROJECT	CATEGORY	MITIGATION — WITH A DATE OR TRIGGER

Categories: technical · schedule · dependency · skill · adoption · maintenance

3 • The five-week arithmetic

Hours a week I *actually* have for building, after class, reading, writing, reviews, and the rest of my life: _____ hrs

_____ hrs × 5 build weeks = _____ total hours

What that honestly buys me: _____

4 • Star your weakest section

The section I have the **least evidence** for: _____ ★

Put a star next to it in Part 1. That is where your peer reviewers start — and where a skeptical reader will too.

Next (6b) — trade with a neighbor

1. Which section is weakest? Name it in criteria language — "the users aren't bounded," not "it's vague."
2. Which claim most needs evidence? Point at one line and ask "how do you know?"
3. Do you believe the five-week arithmetic? Yes or no, and why.

Authors: capture, don't defend. Write down what you hear; decide later what to act on.

Bring a **draft + two printed copies** to the peer-review workshop.
